“DIGITAL LITERACY PROJECT REPORT”

Name – Sanidhya Moondra

Reg No. – 25BAI10230

Branch – Computer Science [AI-ML]

Year – 2026

Course Code – CSE0001

Date – March 24, 2026

INTRODUCTION

As a newly chosen Student Digital Ambassador, my goal is to help my classmates use the internet safely and smartly. Today, being online is a huge part of our lives, whether we are studying, socializing, or applying for jobs. That is why building good digital habits is so important.

This report introduces my first major project: a Digital Literacy Portfolio. I created this portfolio to share with the everyone as an easy to follow guide. It covers five different tasks, each focusing on a key digital skill—like creating a professional profile and communicating responsibly on the web.

All my project files are neatly organized in a GitHub repository so everyone can easily access them. In this report, I will explain my work for each task, share my observations, and reflect on how we can all become better digital citizens.

Task 1 –

Create a Digital Literacy Awareness Infographic

For my visual resource, I chose to use Canva because of its accessible templates and it’s drag-and-drop tool . My poster is designed to serve as a quick-reference guide for people focusing on three core pillars of digital citizenship. First it defines Digital Literacy that emphasizing that it goes beyond basic tool usage into critical thinking. Second it highlights Safe Internet Practices specifically warning against scams and reminding students to use two-factor authentication. Finally it outlines basic Email Etiquettes contrasting casual messaging with the structured format required for communicating with other people.

One thing I found particularly interesting while making this was the challenge of condensing complex concepts into smaller points . It is easy to write a long paragraph about cybersecurity but forcing myself to reduce it to a single icon and a five-word bullet point made me realize how important clear, concise communication is in digital design. Overall, the tool made it easy to create a professional-looking asset that I believe would genuinely help others .

Task 2 –

Build Your Student Digital Portfolio

For my basic digital portfolio I chose to set up profiles on LinkedIn, GitHub, and Kaggle. I selected LinkedIn because it is the industry standard for professional networking and it will be crucial for connecting with experts and alumni. GitHub is essential for version control and hosting code as it acts as a live, technical resume where I can showcase my lab assignments and coding capabilities. Finally I chose Kaggle to explore datasets and participate in beginner machine learning challenges.

Over the next four years my plan is to transition these profiles from basic placeholders to active portfolios. On GitHub I will consistently push code from my major academic projects to show a clear timeline of my technical growth. On LinkedIn I plan to update my skills at the end of each semester and connect with guest speakers and professors. On Kaggle I hope to complete their basic courses and eventually enter introductory competitions. By maintaining these platforms professionally I aim to build a credible and verifiable digital identity well before graduation.

Task 3 –

Explore Coding & Collaboration Platforms

For the platform familiarity task, I utilized HackerRank for coding practice and Google Workspace for creating forms . On HackerRank I got a badge as a beginner by solving few code problems . While the problems were fundamentally simple like printing Hello world! , creating functions , etc. The real value was in learning how to navigate a standard competitive programming interface, read test cases and understand standard input and output formats. For the collaboration requirement I built a Digital Literacy Awareness Quiz using Google Forms ensuring a mix of multiple-choice and short-answer questions. I then linked this form to a live Google Sheet to capture responses automatically.

These tools will be vital academically. HackerRank provides a structured environment to continuously test and improve my coding logic outside of regular lab hours preparing me for technical interviews. Meanwhile, mastering Google Forms and Sheets allows me to efficiently gather data, conduct surveys for research projects and collaborate seamlessly with peers during team assignments without worrying about version control.

Task 4 –

Draft a Professional Email & Etiquette Guide

A classic example of poor digital communication causing a real-world problem occurs when an individual posts about their workplace or interview process on social media. In a well-known hypothetical scenario, a college student tweeted a negative remark about a boring company presentation immediately after a job interview forgetting their profile was public and linked to their real name. The hiring manager stumbled upon the tweet while researching candidates online and promptly rejected the student's job offer, because of lack of professional maturity. What should have been done differently is simple: the student should have maintained a clear boundary between private posting and public platforms. If they felt frustrated, they should have discussed it offline with a trusted friend. Furthermore, routinely auditing privacy settings and pausing to ask, Would I want a future employer to see this? before hitting post would have entirely prevented this career-damaging mistake.

Task 5 –

Cybercrime Awareness Case Study & Prevention Guide

While researching UPI fraud and cybercrime for this assignment, what surprised me most was the heavy reliance on psychological manipulation. I previously assumed cybercrime mostly involved complex and technical hacking to break into accounts. However the most modern scams targeting students in India rely almost entirely on social engineering. Scammers create a false sense of urgency. They don’t hack the banking system instead they hack human behavior by tricking victims into willingly entering their own UPI PINs. As a result of learning this, one personal habit I am changing immediately is how I react to digital notifications. I plan to adopt a strict pause and verify rule. I will no longer rush through digital transactions and will take five extra seconds to read exactly what an SMS, email, or UPI prompt says before clicking approve.

CONCLUSION

Working on this Digital Literacy Portfolio has been an incredible learning journey. By completing the five tasks and setting up the GitHub repository I realized that being digitally literate is about much more than just knowing how to use technology.

My biggest takeaways from this project include:

1] Reputation Matters - Building a professional online profile is crucial for our future careers.

2] Safety First: Protecting our privacy and communicating respectfully to everyone

3] Organization is Key: Tools like GitHub are amazing for keeping our work structured and organized .

Overall, this project taught me that our digital footprint is a lasting reflection of who we are. As a Student Digital Ambassador, I now feel confident and ready to help my classmates make smart, safe, and positive choices online.
